The book presents in-depth reviews of basic concepts and detailed explorations of complex subjects, including classifications and practical topologies, with sample results based on an up-to-date survey of the field. Packed with case studies, this state-of-the-art handbook covers topics such as modeling, steady state, and transients as well as control, design, and testing of linear machines and drives. It includes discussion of types and applications—from small compressors for refrigerators to MAGLEV transportation—of linear electric machines.

Additional topics include low and high speed linear induction or synchronous motors, with and without PMs, with progressive or oscillatory linear motion, from topologies through modeling, design, dynamics, and control. With a breadth and depth of coverage not found in currently available references, this book includes formulas and methods that make it an authoritative and comprehensive resource for use in R&D and testing of innovative solutions to new industrial challenges in linear electric motion/energy automatic control. Rebuild your Allison 1000- or 2000-series transmission with this easy-to-follow book that features step-by-step procedures. Introduced in 1999 by Allison and 2001 by General Motors, the Allison 1000- and 2000-series transmissions have become the most popular heavy-duty transmissions in production today. Used by multiple manufacturers, including GM, Freightliner, International, etc., millions are on roads around the world. Automatic transmissions are often seen as mysterious and overly complicated, but much of the guesswork has been simplified to its basic elements in this easy-to-follow guide. This book covers the identification process, operation, diagnostic pointers, common failures, and repair and rebuild procedures for the 1000- and 2000-series transmissions. Upgrades to make the 1000 more robust for performance applications are covered as well as the companies that offer upgrades. This detailed instructional

manual is authored by Steve Garrett, a service engineer and instructor for General Motors and a member of the Automatic Transmission Rebuilders Association (ATRA). Quality photos of the rebuild process are featured along with torque specifications and identification of all major and most minor components. If you are looking at performing a rebuild project on your own or you just want to know how your Allison works, this is the book for you. This thesis is composed of two independent parts. The first part is devoted to hadronic endcap calorimeter R & D studies for the Large Hadron Collider (LHC) higher luminosity conditions, whereas in the second part a search for new physics at the Compact Muon Solenoid (CMS) experiment is presented. After a brief introduction to the LHC and the CMS experiment, in the first part R & D studies on the active material of hadronic endcap (HE) calorimeter for compact muon solenoid detector upgrade are presented. We performed radiation damage and beam test studies on several wavelength shifter materials, and found that the p-terphenyl deposited quartz plates give improved light efficiency and they are also radiation hard. As a result we propose to substitute the current HE scintillator tiles with p-terphenyl deposited quartz plates for the higher luminosity era of the Large Hadron Collider. In the second part, an inclusive search for new physics with the jets and missing momentum signature

at the Large Hadron Collider is presented for 36pb⁻¹ data collected by the compact muon solenoid detector from March 2010 to November 2010. The emphasis was put on jet resolution measurements for the QCD background estimation with a photon-jet data sample. We did not observe an excess above the background, and thus derived upper limits in the context of R-parity conserving Constrained Minimal Supersymmetric Standard Model (CMSSM) and, more generally in the simplified model spectra. In CMSSM, depending on squark and gluino masses a 95% confidence level (CL) upper limit for cross section of 2-3 pb is obtained, and gluino masses below 500 GeV are excluded with 95% CL for squarks with mass below 1 TeV. In simplified models, depending on the decay chain and mass of the new particles which are pair-produced and decay to either one or two jets and a dark matter candidate, a 95% CL upper limit on the production cross section in the 0.5-30 pb range is obtained. ABSTRACT: This dissertation describes the full details of 2 studies of Z0 bosons performed using the Compact Muon Solenoid detector at the Large Hadron Collider of proton on proton collisions with center of mass energy of 7TeV. The first study searches for physics beyond the Standard Model by looking for an excess in production of Z0 bosons by examining the Z0pT spectrum. As no excess is found, limits on new physics models are presented as a function of mass and other free parameters. The second study focuses on a precision measurement of the Z0pT distribution, and is compared to theoretical calculations for the purposes of testing high order QCD calculations in addition to probing the predictions of various tunes of the underlying event. This volume has a strong focus on homo-oligomerization, which is surprisingly common. However, protein function is so often linked to both homo- and hetero-oligomerization and many heterologous interactions likely evolved from homologous interaction, so this volume also covers many aspects of hetero-oligomerization. Engineers need to acquire “Back-of-the-

Envelope” survival skills to obtain rough quantitative answers to real-world problems, particularly when working on projects with enormous complexity and very limited resources. In the case studies treated in this book, we show step-by-step examples of the physical arguments and the resulting calculations obtained using the quick-fire method. We also demonstrate the estimation improvements that can be obtained through the use of more detailed physics-based Back-of-the-Envelope engineering models. These different methods are used to obtain the solutions to a number of design and performance estimation problems arising from two of the most complex real-world engineering projects: the Space Shuttle and the Hubble Space Telescope satellite. Advances in Atomic, Molecular, and Optical Physics publishes reviews of recent developments in a field which is in a state of rapid growth, as new experimental and theoretical techniques are used on many old and new problems.
