Modelling Spatial and Spatial-Temporal Data: A Bayesian Approach is aimed at statisticians and quantitative social, economic and public health students and researchers who work with spatial and spatial-temporal data. It assumes a grounding in statistical theory up to the standard linear regression model. The book compares both hierarchical and spatial econometric modelling, providing both a reference and a teaching text with exercises in each chapter. The book provides a fully Bayesian, self-contained, treatment of the underlying statistical theory, with chapters dedicated to substantive applications. The book includes WinBUGS code

and R code and all datasets are available online. Part I covers fundamental issues arising when modelling spatial and spatial-temporal data. Part II focuses on modelling cross-sectional spatial data and begins by describing exploratory methods that help guide the modelling process. There are then two theoretical chapters on Bayesian models and a chapter of applications. Two chapters follow on spatial econometric modelling, one describing different models, the other substantive applications. Part III discusses modelling spatial-temporal data, first introducing models for time series data. Exploratory methods for detecting different types of space-time interaction are presented followed by two chapters on the theory of space-time separable (without space-time interaction) and inseparable (with space-time interaction) models. An applications chapter includes: the evaluation of a policy intervention; analysing the temporal dynamics of crime hotspots; chronic disease surveillance; and testing for evidence of spatial spillovers in the spread of an infectious disease. A final chapter suggests some future directions and challenges.

pipeline projects are proposing to transport up to 755 and 700 MMcf/d, respectively, of natural gas from various Canadian sources to southern California for a variety of uses including local distribution companies (LDCs), power generation facilities, electric utilities, industrial gas users, and enhanced oil recovery operations (EOR) throughout southern California. PGT/PG & E's proposal also includes transporting natural gas from Canada to customers in the Pacific Northwest. The book is specially written for PGT Commerce examinations like KVS, NVS, DSSSB, HTET & other state level teaching examinations. The book is an attempt to clarify the theoretical concept and provide practical problem solving aptitude to crack the objective type examinations. This book also contains a scanner of questions asked in previous exams. Besides this, there is a chapter-wise segregation of the exam questions. SGN. Data in the genomics field is booming. In just a few years, organizations such as the National Institutes of Health (NIH) will host 50+ petabytes—or over 50 million gigabytes—of genomic data, and they're turning to cloud infrastructure to make that data available to the research

community. How do you adapt analysis tools and protocols to access and analyze that volume of data in the cloud? With this practical book, researchers will learn how to work with genomics algorithms using open source tools including the Genome Analysis Toolkit (GATK), Docker, WDL, and Terra. Geraldine Van der Auwera, longtime custodian of the GATK user community, and Brian O'Connor of the UC Santa Cruz Genomics Institute, guide you through the process. You'll learn by working with real data and genomics algorithms from the field. This book covers:

- Essential genomics and computing technology background
- Basic cloud computing operations
- Getting started with GATK, plus three major GATK Best Practices pipelines
- Automating analysis with scripted workflows using WDL and Cromwell
- Scaling up workflow execution in the cloud, including parallelization and cost optimization
- Interactive analysis in the cloud using Jupyter notebooks
- Secure collaboration and computational reproducibility using Terra
